

# Milazzo Figure 6 | Reconciled RX direction

VE6PDQ transmitting to KP4MD / WB6RQN

Original publication image retained below; its printed direction is contradicted by the matched reports.

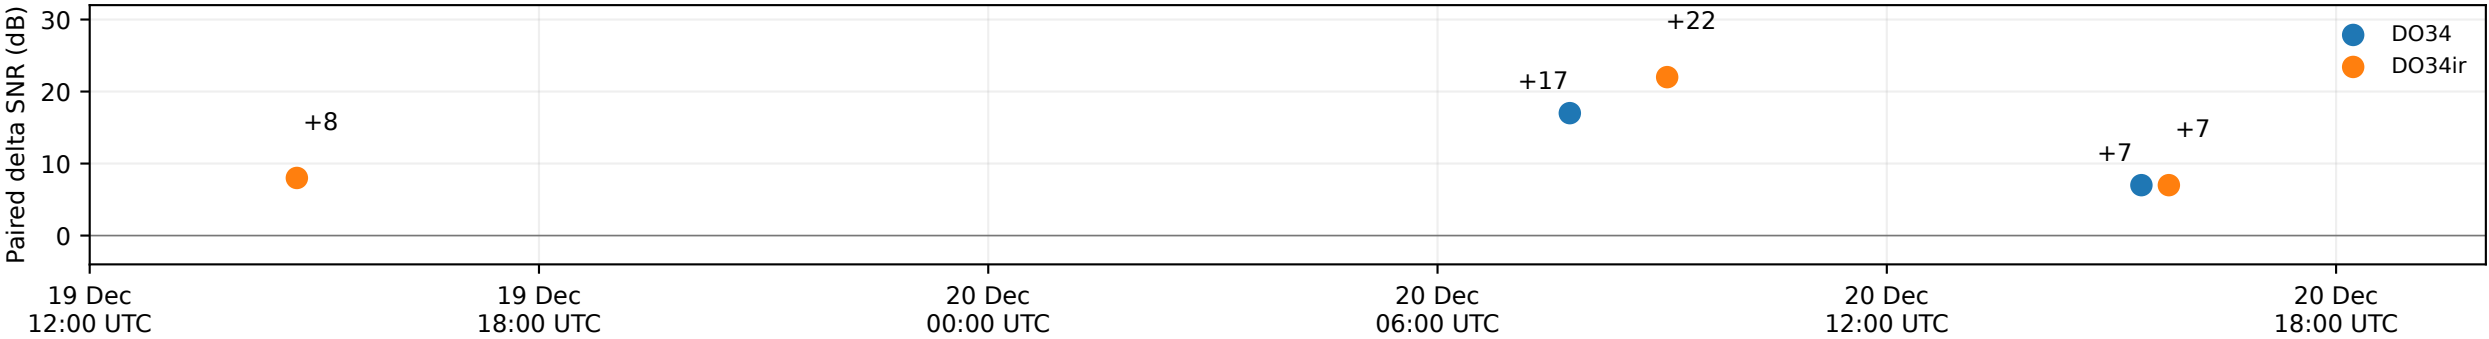

**44 / 44 paper markers match exactly in SNR. All reports are at 5 W: paper SNR = SQL normalized SNR + 7 dB.**

Hollow circles show exact report times; the original image has finite graphical resolution. No fitted axis shift or SNR offset.

**Outer rings: 39/44 reports pass the gate (31 KP4MD + 8 WB6RQN). Gate survival does not imply a Joint pair.**

WSPRadar paired evidence after gating: 5 pairs | KP4MD - WB6RQN | full locator identity

Main overlay includes non-joint reports before the Target-Active Gate. Lower panel uses eligible same-cycle pairs; no gap interpolation.

RX gate scope: supplied VE6PDQ path only. Other transmitters could establish Target activity for an unringed report in the full archive.
